MITTENDORF V., THOMSON J.A.;

Cloning of an endo-(1-->4)-beta-glucanase gene, celA, from the rumen bacterium Clostridium sp. ('C. longisporum') and characterization of its product, CelA, in Escherichia coli.";

GEN. MICROBIOL. 139:2233-3242(1993).

-: FUNCTION: THE PH AND TEMPERATURE OFTIMA OF CELA ARE 4.8 AND 43 DEGREES CELSIUS, RESPECTIVELY. IT HYDROLYSES BARLEY BETA-GLUCAN, LICHENAN, CARBOXYMETHYLCELLULOSE AND XYLAN. IT SHOWS PREFERENTIAL ACTIVITY AGAINST THE LARGER CELLOOLIGOSACCHARIDES (CELLORIZANCE).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ||:|||| |: :|::| : |::|| || |::| : : : : ::|| |||| : : ETAWGNPRVTRELIERIADEGXKSIRIPVTWENRIGGAPDYPIDPQFLNRVDEVVQWALE 118

TO COOSTIGUING CONDITION S.

TO COOSTIGUING CONDITION S.

THE BIOLOGICAL CONVERSION OF CELLULOSE TO GLUCOSE

GENERALLY REQUIRES THERE TYPES OF HYDROLYTIC ENTYMES:

COURSELOANNEED THE TO THE PROPERS OF THE CELLULOSE POLYMER CHAIN;

COURSELOANNEED THAT COUT THE DISSACCHARIDE CELLOBIOSE

COURSELOANNEED THAT THE THAT CHAIN SHOW THE NOW MED WOUNDED THE CELLULOSE POLYMER CHAIN;

COURSELOANNEED THE SENDONE SERVICH HYDROLYZE THE CELLUBIOSE AND OTHER SHORT CELLO-OLIGOSACCHARIDES TO GLUCOSE.

COURSELOANNEED THE SENDONE DEGRADATION.

COURSELOANNEED THAT CHAIN SELECTIONS THIS ENTYME AS WELL AS IN OTHER C.THERMOCELLUM CELLULOSOME ENTYMES. THIS DOMAIN

MAY FUNCTION AS THE BINDING LIGAND FOR THE S. COMPONENT.

COURSELOANNEED THE COURSE FAMILY A (FAMILY 5 OF GLYCOSYLE)

COURSELOANNEED THE COURSE COURSELOANNEED THE SELECTION CELLULASE FAMILY A (FAMILY 5 OF GLYCOSYLE)

THIS DOMAIN MAY FUNCTION AS THE BINDING LIGAND FOR THE SL COMPONENT.
-!- SIMILARITY: THE N-TERMINAL PART BELONGS TO CELLULASE FAMILY A (FAMILY 5 OF GLYCOSYL HYDROLASES).
-!- SIMILARITY: THE C-TERMINAL PART BELONGS TO FAMILY 26 OF GLYCOSYL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               YAGUEE E., BEGUIN P., AUBERT J.-P.;
"Nucleotide sequence and deletion analysis of the cellulase-encoding gene celh of Clostridium thermocellum.";
GENE 89:61-67(1919)
-!- FUNCTION: THIS ENZYME CATALYZES THE ENDOHYDROLYSIS OF 1,4-BETA-GLUCOSIDIC LINKAGES IN CELLULOSE, LICHENIN AND CEREAL BETA-D-

FEBS LETT. 316:137-140(1993).

FERS LETT. 316:137-140(1993).

FERS LETT. 316:137-140(1993).

SENCE LONCTION: THE BIOLOGICAL CONVERSION OF CELLULOSE TO GLUCOSE GREERALLY REQUIRES THREE TYPES OF HYDROLYTIC ENDYMES:

(1) ENDOGLUCANASES WHICH CUT INTERNAL BETA-1,4-GLUCOSIDIC BONDS;

(2) EXCRELOBIOHYDROLAGES TRAT CUT THE DISSACCHARIDE CELLOBIOSE FROM THE NONREDUCING END OF THE CELLULOSE POLYMER CHAIN;

(3) BETA-1,4-GLUCOSIDAGES WHICH HYDROLYZE THE CELLOBIOSE AND OTHER SHORT CELLO-OLIGOSACCHARIDES TO GLUCOSE.

-!-CATALYTIC ACTIVITY: ENDOHYDROLYSIS OF 1,4-BETA-D-GLUCOSIDIC
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   HYDROLASES).
SIMILARITY: CONTAINS 1 FUNGAL-TYPE CELLULOSE-BINDING DOMAIN (CBD).

Mean 35.687; Variance 195.452; scale 0.183 Statistics:

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CBs 670.93, and has been isolated in recombinant form by screening of Escherichia coli clones in plasmid pT218R. The enzyme shows a delta-REM of at least 4 units, preferably at least 5 units, in the Anti Redisposition Test, strong depilling activity, fibre damage of less than 0.05 mu in the Fibre Damage Test, and adsorption of less than 15% in the Adsorption Test. The cellulase may be used in surfactant compositions, and in stonewashing, biopolishing, fabric softener and depilling treatment compositions (claimed). The enzyme does not accumulate on the fabric after repeated laundry washing,

Example 3: Pages 51-53; 83pp; English.

This is the cloned Bacillus agaradherens endoglucanase sequence. This is used in the construction of enzyme hybrids for liquefaction of starch. The enzyme hybrids contain amino acid sequences of alpha-amylase linked to a cellulose binding domain (CBD). The starch is liquefied by treating, in aqueous medium, with such an enzyme hybrid. A recombinant expression vector comprising a construct containing isolated DNA encoding enzyme hybrids with amylolytic activity, promoter and stop signals can be used
                                      01-SEP-1998 (first entry)
Cloned alkaline endoglucanase protein sequence.
Starch, liquefaction; sweetener; enzyme hybrid; endoglucanase; enzyme;
                                                                                                                                                                                                                                                                                                                                                                                                                                              domain

Beoxytic from naturally occuring matter, and hybridises with the DNA of N-4ACMCase gene DIAS-losure; Fig 3, Page 479; 12pp; Japanese.

Disclosure; Fig 3, Page 479; 12pp; Japanese.

Price calculase gene derived from Bacillus sp. No. N-4 is capable of producing specific alkaline cellulase. The DNA can be obtd. from natural sources or by partial synthesis, and can hybridise with DNA of N-4ACMCase
to transform host cells for the production of the recombinant enzyme hybrids. The enzyme hybrids are useful in industrial starch processing especially for the production of sweeteners. Hybrid enzymes have altered affinity for substrate and increased activity, resulting in at least 1 of reduced calcium ion dependence, reduced formation of Maillard reaction products and reduced effect of alpha-amylase on subsequent
                                                                                                                                                                                                                                                                         ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  240

It was expressed in Bacillus Bacillus agaradherens NCIMB 40482. It was expressed in Bacillus cubillis PL2306 transformants following PCR amplification (see T74288-89) of B. agaradherens genomic DNA and ligation of the PCR product into vector pDN1981. DNA encoding the cellulose binding commin (CBD) of the alkaline cellulase was subsequently amplified (see T74290-91) for use in the construction of a novel alpha-amylase-CBD hybrid enzyme (see T74271). A claimed process for removal or bleaching of soiling or stains on a cellulosic fabric comprising a catalytically active portion of a non-cellulolytic enzyme linked to a CBD. The hybrid enzyme gives improved enzyme performance by increasing the affinity of the

This represents a Bacillus agaradherens endoglucanase enzyme. This is used in the construction of enzyme hybrids for liquefaction of starch. The enzyme hybrids contain amino acid sequences of alpha-amylase linked to a cellulose binding domain (CBD). The starch is liquefied by treating, in aqueous medium, with such an enzyme hybrid. A recombinant expression vector comprising a construct containing isolated DNA encoding enzyme hybrids with amylolytic activity, promoter and stop signals can be used to transform host cells for the production of the recombinant enzyme hybrids. The enzyme hybrids are useful in industrial starch processing especially for the production of sweeteners. Hybrid enzymes have altered affinity for substrate and increased activity, resulting in at least 1 of reduced calcium ion dependence, reduced formation of Maillard reaction
                                                                                                                                                                                                                                                                                                                                240

                                                                                                                                                                        comprising a non-cellulolytic enzyme linked to a CBD. The process gives improved enzyme performance by modifying the enzyme so as to increase its affinity for cellulosic fabric.

The 1971stale From T. Marian B.
The Daciluus - contains gene under control of elements from B.
The polypeptide product (Wils78) of p300-CelB fusion construct I (T63226) comprises a hybrid signal peptide, formed between the signal sequences of Bacillus sp. N4 CelB cellulase, and the calker of P300-CelB alkalophilic cellulase. Expression in Bacillus sp. Natrure CelB alkalophilic cellulase. Expression in Bacillus sp. Natrupies of Bacillus sp. Natrupies a 10-40 fold improvement of prodn. of the gene, and an earlier start to the prodn. of enzyme in the formentation process.

The polypeptide product (W12379) of P300-CelB fusion construct 2 (T63327) comprises a hybrid signal peptide, formed between the signal sequences of Bacillus licheniformis ATCC 53926 (P300) alkaline protease and Bacillus lentus alkaline protease (BLAP), and the mature CelB alkalophilic cellulase of Bacillus sp. M4. Expression in Bacillus sp. host cells of P300-CelB fusion constructs 1-4 (see also W12378-80) provides a 10-40 fold improvement in prodn. of the alkalophilic cellulase in comparison to expression of the native gene, and an earlier start to the prodn. of enzyme in the fermentation process.

Lichenifornia alkaline protease gene bisclosure; Fig 9,94,98; 37pp; English.

The polypeptide product (W12380) of P300-CelB fusion construct 3 (T63228) comprises the signal peptide of Bacillus lichenifornis alkalophilic cellulase of Bacillus sp. N4. Expression in Bacillus sp. host cells of P300-CelB fusion constructs 1-4 (see also W12378-79, W12381) provides a 10-40 fold improvement of prodn. of the alkalophilic cellulase in comparison to expression of the native gene, and an earlier start to the prodn. of enzyme in the
                                                                                                                                                                                           pyaeevipvirnndpnniilvgtgtwsqdvhhaadngltdpnvmyafhfyagthgqnlrd

PT cellulosic fabric - uses cellulase compsn. able to hydrolyse printrophenyl - beta-1,4-celluloside

PT pritrophenyl - beta-1,4-celluloside

PD sclosure; Pages 15-17; 23pp; English.

CC The present sequence is the corrected version of the incorrect macilius lautus (NCTMB 40250) endoglucanase Endo 3A described in WO9110732. Endo 3 can be used in novel method of forming localised colour density variation on the surface of a dyed cellulosic fabric. The method comprises agitating the fabric in an aqueous colour density variation on the surface of a dyed cellulosic fabric. The method comprises agitating the fabric in an aqueous colour present sequence, which can hydrolyse p-introphenyl-beta 1,4-cellobioside, or a family 7 cellulase, and a mechanical darading agent or cellulose having abrading activity. Each cellulase displays 30 % or more of its maximum activity at pH 7. The process is useful to provide a stone washed look to blue jeans

The enzyme is encoded by a 11000 bp. EcoRI fragment of Bacillus spp. PL236 DNA contained in plasmid pPL591. It exhibits an endoglucanase activity of at least 10 (pref. at least 25) carboxymethyl cellulose (CMC) endoase units per mg total protein under alkaline conditions. It is especially useful as a cellulolytic agent and has been found to be more stable during washing (60 mins. at 40 deg.) in the presence of conventional detergents than a commercial cellulase preparation. It may also show increased storage stability in 11q. detergents contg.

C proteases. The sequence was deduced from the DNA (013003), it is a product of the endo3 gene. See also R13227 and R13228.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  13 vltmvlmvglllpvgarkgyaa-pavp-fgelkvqgnqlvgqsgqavqlvgmsshglqwy 70

## ALIGNMENTS

A novel cellulase (W00383), designated BCE 113, of alkali-tolerant Bacillus sp. straint CBE 669 93 has a tensile strength loss to antipithing ratio below. The CBE 69 93 has a tensile strength loss to antipithing ratio below. The CBE 69 93 fermentation broth or expressed at high levels in transformed host cells utilising an isolated gene sequence (41884). Cellulase BCE 113, and similarly isolated cellulase BCE 103 (see also W00382), detergent compsns. to provide anti-greying, softening, anti-sequence 574 AA; Cellulase with low ratio of tensile strength loss to antipilling properties - used in detergent composition which provides anti-greying, softening, anti-winkling and colour protection to fabrics ŗ 77..574

my total protein under alkaline conditions. It is especially usef as a cellulolytic agent and has been found to be more stable duri washing (60 mins. at 40 deg.)in the presence of conventional detergents than a commercial cellulase preparation. It may also show increased storage stability in liq. detergents conty. proteases. The sequence was deduced from the DNA (013002), it is product of the endo2 gene. See also R13227 and R13229.

Clone pCNP4.1 encodes celb. It was derived as follows. N. patrictarum was used to construct a cDNA library in ZAPII (in E. coli). Transformants were selected for enzyme activity using selective media. 11 colonies were positive, and of these 10 had the same restriction pattern, and the longest of these was designated celb (pCNP4.1)(Q55036)(R47496, R4910.2). A similar process was used to isolate the xylanase clone pNX-Tac (Q55037,R47497). An enzyme composition contg. celb and xylanase is claimed.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           celD cDNA in clone pCNP4

rumen or silage bacteria

clone pCNP4.1 encodes celD. It was derived as follows N.

patriclarum was used to construct a cDNA library in ZAPII (in E.

coli). Transformants were selected for enzyme activity using

selective media. Il colonies were positive, and of these 10 had th

same restriction pattern, and the longest of these was designated

celD (pCNP4.1)(Q55036)(R47496,R49102). A similar process was used

composition cont.. celD and xylanase is claimed.

452 AA;
DNA fragment producing slightly acidic low-temp. cellulase -
lisolated from DNA of Runthnococcus albus that is partly modified.

Claim 1: Fig 1: 11pp; Japanese.

The gene product is modified by a 15-24 AA N-terminal deletion ar as shorter. C-terminal deletion to give a gene product which has optimum activity in slightly acidic low temperature conditions. A plasmid encoding the sequence may be used to transform a host;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (CSIR.) industries. The enzyme is also used to treat lactose intolerance, as a dlaganostic reporter molecule, in corn wet milling or in the fruit juice industry. The enzymes can be used to Mydrolyse guar gum to remove non-reducing terminal mannose residues. The nucleic acids encoding the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence represents endoglucanase isolated from Thermotoga. The enzyme or its encoding nucleic acid sequence is used for generating glucose from soluble oligosaccharides. The enzyme can be used in the food processing, pharmaceutical, textile, detergent and baking
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      62 nignalea--pfegawgv-rieheyfeiinkrgfdsvripirwsahisekppydidrnfl 118

This is the amino acid sequence of endoglucanase OCI/4V, deduced from a polynuclectide (see V36919) of a Thermotoga sp. OCI/4V clone (33GP1) that grows optimally at 75 degC. The sequence shows 65% amino acid identity to an endo-1,4-beta-endoglucanase of caldocellum, The invention provides IB polynuclectides (see V36907-24) coding for thermostable glycosidases (see W49888-75) having glucosidase, alpha-galactosidase, beta-galactosidase,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          enzyme may be used to generate probes to identify similar sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Glycosidase; OCL/4V; thermostable enzyme; oligosaccharide; glucose; sugar; baking; textile; detergent; endoglucanase.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 mkflnslsllglviagceamrniss-kelvkeltigwslgntldascvetlnyskdgtas 59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          1 MKWMKSMVWLAVVLVVSFVAPAVSSANEDVKTLDIQ-SYVRDMQPGWNLGNTFD-AVGQD 58
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New recombinant DNA encoding Orpinomyces cellulase protein - useful for, e.g. producing recombinant Orpinomyces cellulase in host cell claim 1; Page 38 40; 69pp; English.

This polypeptide comprises cellulase celb of Orpinomyces sp. strain oc.2, an anaerobic bowine rumen fungus Orpinomyces sp. PC-2. Its amino acid sequence was deduced from an isolated cDNA clone (see V29477). Celb has cellobiohydrolase activity with highest activity at pH 5.2-6.2 and 50 degc. CelA (see W56738) and celC (see W56739) cellulolytic enzymes of Orpinomyces sp. PC-2 are also provided. Recombinant DNA molecules encoding Orpinomyces cellulase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  proteins are claimed, as well as recombinant cells selected from Saccharomyces cerevisiae, Escherichia coli, Aspergillus, Trichoderma reesei, Pichla, Penicillium, Streptomyces or Bacillus, and a method for producing recombinant cellulase by culturing these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                292 iigef--vamnrdn---ed-drerwqeyyikkatalgipcviwdng-yfe 334

beta-mannosidase, beta-mannanase, endoglucanase or pullulanase activity. Vectors and host cells are also claimed. A method is provided for producing the enzymes by recombinant techniques. A claimed method for generating glucose from soluble cell oligosaccharides comprises contacting a sample (selected from adairy products, fruit juice, detergent, textile, quar qum, animal feed, plant blomass or waste product) containing oligosaccharides stachyose, verbascose, cellubiose, lactose, sucrose, raffinose, stachyose, verbascose, cellulose, starch, amylose, glycogen, disaccharides, polysaccharides and pullulan) with one of the sequence 360 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Score 326; DB 36; Length 360;

Regulatory sequence for Trichoderma viride derived cellulase cbhl gene - for producing Humicola insolens derived endo-glucanase bisclosure; Pages 48-51; 92pp; Japanese.

The present sequence appears in the specification. The specification describes a new regulatory sequence for Trichoderma viride derived cellulase cbhl gene and the establishment of a system for mass producing cellulase in moulds such as T. viride. As the regulatory sequence of cbhl genes originating in T. viride can highly express objective proteins, proteins such as callulase can be expressed. An expression vector containing the regulatory sequence and Humicola insolens derived endo-glucanase NCE4 DNA was produced, and used to produce endo-glucanase Sequence 418 AA;

New DNA encoding endo-glyco-ceramidase - useful in structural and functional analysis of glyco-liphd(s).

Tunctional analysis of glyco-liphd(s).

Claim I: Page II-13; ZSpp; English.

The sequences given in W10209-10 represent full length and mature endoglycoceramidase respectively, which is useful in structural and functional analysis of glycolipids in sugar chain engineering.

Recombinant endoglycoceramidase can be produced with high purity at relatively low cost using the DNA sequences encoding these proteins.

Disclosure; Fig 2A-C; 92pp; English.

Endoglucanase-II (2C-II) is used in an animal feed-additive to produce a cereal-based animal feed, especially for fowl. EG-II any be produced recombinantly, optionally without the callulose-binding domain. The feed-additive can be incorporated into a cereal-based feed (barley, wheat, triticale, rye and maize) where it improves the conversion ratio and/or increases the conventional cereal-based feed to by modified by reducing its conventional cereal-based feed to by modified by reducing its maintaining the same nutritional levels of energy, protein and/or amino acid content while simultaneously maintaining the same nutritional levels of energy, protein and amino acids available to the animal. The feed-additive also contains cellobiohydrolase, and optionally a xylanase, protease,

Pure, truncated fungal cellulase protein from Trichoderma - useful to reduce or eliminate dye, colourant or pigment back-staining or reduce or eliminate dye, colourant or pigment back-staining or redeposition in stone-washing or bio-polishing Claims 17, 41, 63, 64, 65; Figure 4, 105pp; English.

Figure 4 depicts the genomic DNA and AA Sequence of EGII derived from T. longibrachiatum. A truncated fungal cellulase which consists essentially of the AA Sequence in SEQ ID no. 8 is claimed. Also claimed are DNA gene fragments encoding SEQ ID no. 8 is claimed. Consists essentially of the AA Sequence in SEQ ID no. 8 is claimed. Consists essentially of the AA sequence in SEQ ID no. 8 is claimed. Consists essentially of the AA Sequence or in Seq ID no. 8 is claimed. Consists essentially of the AA Sequence or isolated from T. longibrachiatum and the protein domain structure has been confirmed (Penttila, M. Et al., 1986, Gene 45, 253-263; Van Arsdell, J.N. et al., 1987, Gene 63, 11-21).

Sequence 418 AA;

                                                                                                                                                                                                                                                                                Disclosure; Fig 4A-4C; 124,002.

The amino acid sequences for Trichoderma longibrachiatum cellobohydrolase I (CBHI) (W02025), cellobohydrolase I (CBHI) (W02025), endoglucanase I (EGI) (W02029), EGII (W02032) and EGIII (W02034) were deduced from the respective genomic DNA sequences (T32220-24). The CBHI, CBHII, EGI and EGII enzymes have catalytic core domains useful for reducing dye redeposition (backstaining) on cellulose-contg. fabrics such as denim, whilst maintening or increasing abrasion during stonewashing. Truncated enzymes comprising these catalytic core domains can be obtd. by proteolysis of the complete enzyme or by inserting the appropriate bnA fragment into a vector, using this to transform a Trichoderma sp. host cell, and recovering the recombinant core domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           142 vnedgmtifrlpvgwqylvnnnlggnldstsiskydqlvqgclslgayc1vd1hnyar-w 200

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Trichoderma harzianum (CBS 243.71) beta-(1,6)-endoglucanase may be produced recombinantly, and has a molecular weight of about 50.000, an apparent isoelectric point of 5.6, an optimal temperature of activity of about 100 U/mg. The enzyme, or compositions enriched in it, are used to omodify or degrade beta-glucans, particularly for recovery of desirable products produced by the microorganisms. Tupturing or lysing cell walls of microorganisms thereby enabling recovery of desirable products produced by the microorganisms. Typical applications include the production of protoplasts and yeast extracts, use in wine and press juice making, as fungicides, to remove excess dye from textiles, to remove moulds on coatings or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Beta-(1,6)-endoglucanase.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Mean 51.634; Variance 110.240; scale 0.468

Mol. Gen. Genet. (1992) 231:472-479
Analysis of functional domains of endoglucanases from
Clostridium cellulovorans by gene cloning, nucleotide
sequencing and chimeric protein construction.

Gen. Microbiol. (1993) 139:3233-3242
Cloning of an endo-(1-->4)-beta-glucanase gene, celA, from
the rumen bacterium Clostridium sp. ('C. longisporum') and
cehracterization of its product, CelA, in Escherichia coli.
